Notes

Part I

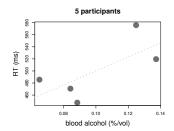

Correlation

|             | Correlation | Interpreting | Basics | Covariance | Coefficients |
|-------------|-------------|--------------|--------|------------|--------------|
| Correlation |             |              |        |            |              |
|             |             |              |        |            |              |

- in correlation, both variables are ordinal or better
- $\blacksquare$  aim of the game is to find out whether they're related
- $\blacksquare$  no special status for 'IV' or 'DV', other than by interpretation
- is blood alcohol related to reaction time?
- lacktriangledown as blood alcohol increases, does reaction time change systematically?

Martin Corley UMSR 6

Scatterplot

■ each point represents pair of values for one participant

Martin Corley UMSR 6

Simpler Data

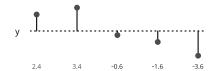

5 participants

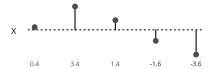

- does y vary with x?
   equivalent to asking 'does y differ from its mean in the same way that x does?' Martin Corley UMSR 6

| Notes |  |  |  |

|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |

Notes

#### Covariance

 $\blacksquare$  if observations of each variable differ proportionately from their means, it's likely the variables are related

Martin Corley UMSR 6 7

#### Notes

| _ |  |  |  |
|---|--|--|--|
|   |  |  |  |
|   |  |  |  |
|   |  |  |  |
|   |  |  |  |
|   |  |  |  |
|   |  |  |  |

#### Covariance

#### Variance

$$s^{2} = \frac{\sum (x - \bar{x})^{2}}{N} = \frac{\sum (x - \bar{x})(x - \bar{x})}{N}$$

Covariance

$$cov(x,y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{N}$$

Martin Corley UMSR 6

Notes

Covariance

0.96 11.56 -0.84 2.56 12.96

$$cov(x, y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{N} = \frac{27.2}{5} = 5.44$$

| Votes |  |  |  |
|-------|--|--|--|
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |
|       |  |  |  |

#### The Problem With Covariance

- covariance expresses the 'amount of shared variance'
- $\blacksquare$  but it depends on the  $\mathit{units}$
- $\blacksquare$  imagine the last example was in  $\textit{miles}.\ .\ .$
- lacktriangle if we measured the same distances in km, the covariance would be 14.09 instead of
- we need some way to *standardise* covariance

Martin Corley UMSR 6

#### Correlation Coefficient

lacktriangle the standardised version of covariance is the **correlation coefficient**, r

$$r = \frac{\mathsf{covariance}(x,y)}{\mathsf{standard \ deviation}(x) \cdot \mathsf{standard \ deviation}(y)}$$

Martin Corley UMSR 6

#### Correlation Coefficient

Pearson's Correlation Coefficient

$$r = \frac{\frac{\sum (x - \bar{x})(y - \bar{y})}{N}}{\sqrt{\frac{\sum (x - \bar{x})^2}{N}} \sqrt{\frac{\sum (y - \bar{y})^2}{N}}} = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2} \sqrt{\sum (y - \bar{y})^2}}$$

$$=\frac{27.2}{\sqrt{33.2}\sqrt{29.2}}=\frac{27.2}{5.76\cdot5.40}=\frac{27.2}{31.14}=0.87$$

Martin Corley UMSR 6 12

Notes

Correlation Interpretin

Barine Constitute Coefficients

#### Spearman's $\rho$

#### Spearman's Correlation Coefficient

Spearman's  $\rho$  is calculated in *exactly the same way* as Pearson's r, but uses the **ranks** of x and y ( $x_r$  and  $y_r$ ) instead of their *values* 

$$\rho = \frac{\sum (x_r - \bar{x}_r)(y_r - \bar{y}_r)}{\sqrt{\sum (x_r - \bar{x}_r)^2} \sqrt{\sum (y_r - \bar{y}_r)^2}}$$

 $\blacksquare$  for our toy data,  $\rho=0.9$ 

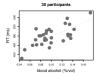

Martin Corley UMSR 6

Correlation Interpreting

Scatterplate Significance Causates

#### Correlation Coefficient

- measure of *how related* two variables are
- $\blacksquare$   $-1 \le r \le 1$  ( $\pm 1 = \text{perfect fit, 0} = \text{no fit}$ )
- lacksquare sign tells you direction of slope

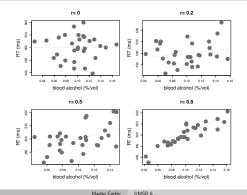

30 participants

**■** r = 0.7

r = -0.7

Correlation Interpretin

Scatterplots Significance Cavea

#### Significance of a Correlation

- $\blacksquare$  we can measure a correlation using r or  $\rho$  as appropriate
- $\blacksquare$  we want to know whether that correlation is significant
  - $\blacksquare$  i.e., whether the probability of finding it by chance is low enough
- cardinal rule in NHST: compare everything to chance
- let's investigate...

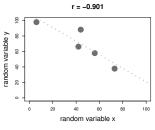

Martin Corley UMSR 6

|       |  |  |  |
|       |  |  |  |

### As the Sample Tends to $\infty$

lacktriangle distribution of random rs is tdistribution

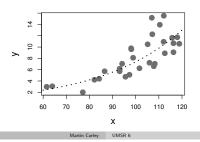

$$t = r\sqrt{\frac{N-2}{1-r^2}}$$

- makes it 'easy' to calculate probability of getting *r* for sample size *N* by chance
- in practice, use look-up tables

Martin Corley UMSR 6

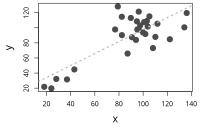

#### Beware False Positives

- correlations assume a *linear* relationship
   but the relationship might be something else. . .

#### Beware False Positives

#### correlation = 0.79

- correlation driven by a few unusual observations
- always look at scatterplots together with calculations

#### Interpreting Correlation

- $\hfill \blacksquare$  correlation does not imply causation
- $\hfill \blacksquare$  correlation merely suggests that two variables are related

# Regression Intro Basics Example Visualisation A Subset of the Data with(n2, plot(RT - log(freq + 1), pch = 16))

(NB., add 1 to freq to avoid log(0))

Martin Corley UMSR 6 31

Correlation

Intro Basics Example Visualisation

 $\blacksquare$  is word frequency related to time to name a word?

```
# could use cor.test(-RT+log(freq+1),data=n2)
with(n2, cor.test(RT, log(freq + 1)))
##
## Pearson's product-moment correlation
##
## data: RT and log(freq + 1)
## t = -3, df = 20, p-value = 0.006
## alternative hypothesis: true correlation is not equal to 0
## 35 percent confidence interval:
## -0.78 -0.18
## sample estimates:
## correlation is not equal to 0
## 50 percent confidence interval:
## -0.75 -0.18
```

- yes it is, negatively
- lacktriangle RT goes down as frequency goes up
- $_{\blacksquare}$  but is that really  $\emph{all}$  we can say?

Martin Corley UMSR 6

Linear Models

Linear Model

$$\hat{y_i} = b_0 \cdot 1 + b_1 \cdot x_i$$

$$y \sim 1 + x$$

Martin Corley UMSR 6

Notes

#### A Linear Model

900 800 200 900 log(freq + 1)

■ a linear model describes the best line through the data ■ the best-fit line minimizes the residuals

Martin Corley UMSR 6

Notes

#### Residuals

 $\blacksquare$  each  $\hat{y_i}$  is an estimate according to the model

 $\blacksquare$  the *real* observation for each  $x_i$  is  $y_i$ 

 $\mathbf{v}_i - \hat{y}_i$  is the **residual**,  $\epsilon_i$ 

 $\hat{y}_i = b_0 + b_1 x_i$ the best-fit line  $y_i = b_0 + b_1 x_i + \epsilon_i$ 

the data

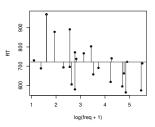

Notes

Martin Corley UMSR 6

#### Total Sum of Squares ( $SS_{total}$ )

$$\mathsf{SS}_\mathsf{total} = \sum (y - \bar{y})^2$$

- sum of squared differences between observed y and mean  $\bar{y}$
- how much does the observed data vary from a model which says 'there is no effect of x' (null model)?

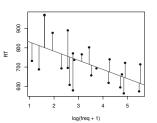

Martin Corley UMSR 6

# Residual Sum of Squares ( $SS_{residual}$ )

$$SS_{residual} = \sum (y - \hat{y})^2$$

- sum of squared differences between observed y and predicted  $\hat{y}$
- how much does the observed data vary from the existing model?

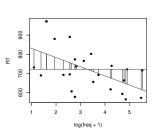

Martin Corley UMSR 6

## Model Sum of Squares ( $SS_{model}$ )

$$\begin{split} \mathsf{SS}_{\mathsf{model}} &= \sum (\hat{y} - \bar{y})^2 \\ &= \mathsf{SS}_{\mathsf{total}} - \mathsf{SS}_{\mathsf{residual}} \end{split}$$

- sum of squared differences between predicted  $\hat{y}$  and mean  $\bar{y}$
- how much does the existing model vary from the null model?

Martin Corley UMSR 6

| N | ot | es |
|---|----|----|
|   |    |    |

Notes

#### Testing the Model: $R^2$

How much of the variance does the model account for?

$$R^2 = \frac{SS_{model}}{SS_{total}}$$

- $\blacksquare$  indicates how much the model improves the prediction of  $\hat{y}$  over the null model
- $\quad \blacksquare \ O \leq R^2 \leq 1$
- $\blacksquare$  we want  $R^2$  to be large
- $\blacksquare$  for a single predictor,  $\sqrt{R^2} = |r|$  (where r is Pearson's correlation coefficient)

Martin Corley UMSR 6

#### Testing the Model: F

- $\quad \blacksquare \ \mathsf{MS}_x = \mathsf{SS}_x/\mathsf{df}_x$

How much does the model improve over chance?

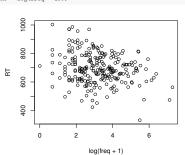

$$F = \frac{\mathsf{MS}_{\mathsf{model}}}{\mathsf{MS}_{\mathsf{residual}}}$$

- $\blacksquare$  indicates how much better the model predicts  $\hat{y}$  compared to chance
- $\blacksquare$  we want F to be large
- lacktriangle significance of F does not always equate to a large (or theoretically sensible) effect

Martin Corley UMSR 6

# This Time, for Real

with(naming, plot(RT ~ log(freq + 1)))

Martin Corley UMSR 6

Notes

Notes

```
Correlation
```

1000 800 400

$$t = r\sqrt{\frac{N-2}{1-r^2}}$$

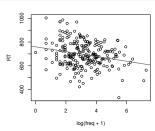

```
r <- with(naming, cor(RT, log(freq + 1)))
r</pre>
pt(r * sqrt((length(naming[, 1] - 2)/(1 - r^2))), df = 22) ## [1] 0.00041
```

log(freq + 1)

Martin Corley UMSR 6

#### This Time, for Real

with(naming, plot(RT ~ log(freq + 1)))

 $\blacksquare$  a linear model can tell us more about the data. . .

Martin Corley UMSR 6

#### A Simple Linear Model

 $\label{eq:model} \begin{array}{ll} \texttt{model} \; \leftarrow \; \texttt{lm(RT} \; \sim \; \texttt{log(freq + 1)} \,, \; \texttt{data = naming)} \\ \texttt{summary(model)} \end{array}$ 

- $\blacksquare$   $R^2$  and F are basic indicators of how 'good' a model is
- part of R's output when summarising an lm object
- we'll revisit adjusted R<sup>2</sup> later

Martin Corley UMSR 6 45

Notes

Notes

#### A Simple Linear Model

```
summary(model)
## Call:
## lm(formula = RT ~ log(freq + 1), data = naming)
```

- lacktriangle glancing at Residuals gives an indication of whether they are roughly symmetrically distributed
- $\blacksquare$  the Coefficients give you the model
- $\blacksquare$  the Estimate for (intercept) is  $b_0$
- lacksquare the Estimate for log(freq + 1) is  $b_1$ , the **slope**

Martin Corley UMSR 6

46

# Coefficients

# ## (Intercept) 759.87 18.04 42.13 < 2e-16 \*\*\* ## log(freq + 1) -20.24 5.25 -3.85 0.00015 \*\*\*

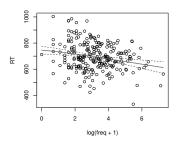

- independently of whether the model fit is 'good', coefficients can tell us about our data
- lacktriangledown here, the (Intercept)  $b_0$  isn't that useful
  - ightarrow it takes 760ms to name 'zero-frequency words'
- lacksquare but the slope  $b_1$  of  $\log(\text{freq} + 1)$  is quite informative
  - $\rightarrow$  words are named 20ms faster per unit increase

  - this is a significant finding

    calculated from the estimated coefficient and its Std. Error, using the t distribution

Martin Corley UMSR 6

#### Visualisation (using predict())

(confidence intervals for the model)

Martin Corley UMSR 6

## Multiple R-squared: 0.0587, Adjusted R-squared: 0.0548
## F-statistic: 14.8 on 1 and 238 DF, p-value: 0.00015
```

- slope unchanged
- $\blacksquare$  695ms corresponds to words of mean log frequency

Martin Corley UMSR 6

Scaling of Predictors

 $\blacksquare$  linear scaling of predictors doesn't change model fit

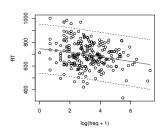

```
summary(model)$r.squared
## [1] 0.059
summary(model.S)$r.squared
## [1] 0.059
summary(lm(RT ~ I(5 * log(freq + 1)), data = naming))r.squared
```

■ non-linear scaling—like log() above—changes fit

```
summary(lm(RT ~ freq, data = naming))$r.squared
```
